TEST CASES

Date	30 September 2026
Team ID	6ab4756eb5170a9b58b3f57e
Project Name	**Script-Controlled ACL – Restrict Record Access Based on Field Value**
Maximum Marks	3 Marks

TEST CASES

Script-Controlled ACL – Restrict Record Access Based on Field Value

These test cases are designed from the project requirements and implementation described in the supplied project transcript. They verify user and role configuration, Institution Details data, branch-based Read restriction, and role-based Create, Write and Delete ACLs.

Test Environment

Item	Configuration
Platform	ServiceNow Developer Instance
Table	Institution Details
Branches	ECE, EEE, CSC
Roles	BB1, BB2, BB3, BB4
Read restriction	Branch = EEE with script-controlled authorization

Test Case Matrix

Test ID	Test Area	Test Procedure	Expected Result	Status
TC-01	User creation	Create the project test user with required user details.	User record is created and saved successfully.	Pass / Fail
TC-02	Role creation	Create roles BB1, BB2, BB3 and BB4.	All four roles are created successfully.	Pass / Fail
TC-03	Role assignment	Assign the required role(s) to the configured project user.	User receives the assigned role and can be evaluated against the ACL.	Pass / Fail
TC-04	Table creation	Create the Institution Details table with the required fields.	Table and fields are available in ServiceNow.	Pass / Fail
TC-05	Branch choices	Configure ECE, EEE and CSC as Branch choices.	All three branch choices are available.	Pass / Fail
TC-06	Sample records	Create sample records for ECE, EEE and CSC branches.	Records are created and displayed in Institution Details.	Pass / Fail
TC-07	Read ACL – EEE	Access Institution Details as the configured BB1 user and request an EEE record.	EEE record is accessible when the ACL conditions are satisfied.	Pass / Fail
TC-08	Read ACL – ECE	Access Institution Details as the configured BB1 user and request an ECE record.	ECE record is restricted by the EEE branch condition.	Pass / Fail
TC-09	Read ACL – CSC	Access Institution Details as the configured BB1 user and request a CSC record.	CSC record is restricted by the EEE branch condition.	Pass / Fail
TC-10	Create ACL	Attempt to create an Institution Details record using the user with BB2.	Create operation is permitted when the required role is satisfied.	Pass / Fail
TC-11	Write ACL	Attempt to modify an Institution Details record using the user with BB3.	Write operation is permitted when the required role is satisfied.	Pass / Fail
TC-12	Delete ACL	Attempt to delete an Institution Details record using the user with BB4.	Delete operation is permitted when the required role is satisfied.	Pass / Fail
TC-13	Unauthorized operation	Attempt an ACL-controlled operation without the required role.	The operation is restricted by the corresponding ACL.	Pass / Fail
TC-14	ACL script validation	Verify that the Read ACL script evaluates the Branch field for EEE.	The script authorizes the EEE record and restricts non-EEE records.	Pass / Fail

TEST CASES

TC-15	Final list validation	Open Institution Details using the configured project user.	The resulting records match the configured branch-based access rule.	Pass / Fail
TC-16	Administrator validation	Review Institution Details using an authorized administrator.	Administrator can access the records required for management and verification.	Pass / Fail

Acceptance Criteria

- The required user and four roles (BB1–BB4) are successfully configured.
- The Institution Details table contains the required fields and branch choices.
- Sample ECE, EEE and CSC records can be created and identified correctly.
- The Read ACL restricts the configured project user according to the EEE branch condition.
- Create, Write and Delete operations are controlled by their respective roles.
- Unauthorized operations are denied by the applicable ACL.
- The final test confirms that the configured access behavior matches the project requirement.

Test Result Recording

During actual execution, the tester should record Pass or Fail in the Status column and attach the corresponding ServiceNow screenshot as evidence. Any failed test should be retested after correcting the relevant configuration or ACL rule.
